Auzaarbazaar business model

Auzaarbazaar is positioned as a B2B industrial equipment marketplace + multi-tenant SaaS where the core transaction mechanism is RFQ → quote → negotiation → order (not “add to cart”).

The value exchange

Buyers (manufacturers): discover machines, shortlist suppliers, send RFQs, compare quotes, manage negotiation + documentation in one place.
Sellers (suppliers/dealers/OEMs): list inventory, capture RFQ leads, respond with quotes fast, manage pipeline, get visibility and trust signals.
Platform: improves match quality + trust + response times, and monetizes seller distribution + workflow + data.

Revenue streams (stackable)

Seller subscriptions (SaaS)
Pay for lead management + analytics + listing limits + team seats + integrations.
This becomes your predictable recurring revenue.

Promoted visibility (marketplace ads)
Featured listings, top search placement, category spotlight, region boosts.
This scales with GMV and inventory volume.

Transaction services (optional, high leverage)
UPI / payment facilitation fee (if you enable payments)
Logistics coordination fee
Inspection / verification service fee
Financing referral fee (NBFC/bank partnerships)

Enterprise / API
Large buyers: procurement workspace, vendor onboarding, SLA reporting.
OEMs: dealer network listings + analytics.

A strong model is: SaaS (base) + Ads (scale) + Services (margin).

Multi-tenant SaaS webapp overview

What “tenant” means in Auzaarbazaar
A tenant = an organization (org), typically a company:

Buyer org (manufacturer)
Seller org (supplier/dealer/OEM)
Some orgs can be both.

Edit with WPS Office

A single user can belong to multiple orgs with roles.

Tenant boundaries
Each org has isolated:
team members & permissions
listings (seller org)
RFQs (buyer org)
quotes, conversations, documents
analytics and billing
This is why we designed everything around orgs + org_members + RLS.

Product surface area (what the webapp actually is)

1) Public marketplace (top of funnel)
Landing + category browsing
Search + filters (industrial-grade)
Listing pages + supplier profiles
“Post RFQ” entry point
Goal: convert anonymous traffic into RFQs and verified sellers.

2) Buyer workspace (procurement OS)
Core modules:
Search + shortlist
RFQs (create, broadcast, track status)
Quotes (compare, request revisions)
Messages + documents (spec sheets, drawings, quotation PDFs)
Orders (optional at first, but future-ready)
Supplier comparison + trust signals
Goal: reduce buying friction and procurement chaos.

3) Seller workspace (sales OS)
Core modules:
Listings manager (inventory, specs, media)
RFQ inbox (pipeline: new → responded → quoted → negotiation → won/lost)
Quotation builder (structured + PDF attachment)
Messaging (with files + negotiation trail)
Analytics (views → RFQs → conversion; demand by region)
Promotions (pay to boost visibility)
Billing
Goal: turn supplier inventory into a predictable lead + sales pipeline.

4) Admin / Ops console (market integrity)
Category/spec schema management
Seller verification workflows (GST/address/docs)

Edit with WPS Office

Moderation (spam, duplicate listings)
Dispute management (if orders)
Marketplace analytics (supply/demand, response SLAs)
Goal: trust + quality control + growth levers.
The “engine” that makes it work
The core object graph
Listing (Supply) → belongs to seller org
RFQ (Demand) → belongs to buyer org
RFQ Targets → which sellers received it
Quote → seller response to RFQ
Conversation → ties to RFQ/quote/order
Documents → storage paths governed by org-based RLS
Promotions → visibility monetization
Metrics → analytics + ranking
This gives you a clean funnel: Search → Listing → RFQ → Quote → Negotiation → Order/Close

Why this wins in India (practically)
Auzaarbazaar shouldn’t try to “out-IndiaMART IndiaMART.” It should win by being:
workflow-native (RFQ + quoting + negotiation + docs)
trust-native (verification + response score + SLA)
data-native (demand heatmaps, price ranges, conversion analytics)
seller-ops native (pipeline + team + automation)

A clean monetization tiering (simple, effective)
Sellers
Free: limited listings + basic RFQ inbox
Pro: more listings, faster lead notifications, quote templates, basic analytics
Growth: team seats, advanced analytics, region targeting, CRM export, promotions credits
Enterprise/OEM: multi-branch, dealer network, API, SLAs, account manager
Buyers
Free: RFQ + quote comparison
Business: team workflow, approvals, vendor onboarding, reporting
(Usually, buyers stay mostly free to maximize RFQs; sellers fund the platform.)
